Linking Study Updates

Date	Description
2010-08	Initial study conducted for Iowa in reading and mathematics using Fall 2007, 2008, and 2009 data.
2017-10	Iowa used the results from the Smarter Balanced Assessment Consortium (SBAC) linking study report.
2020-12-22	Incorporated the 2020 MAP Growth norms using Spring 2019 data for ELA and mathematics Grades 3–8. Not enough data available to include science.
2021-11-02	Added the Grades 9–10 cut scores using Spring 2019 data. Not enough data available to include ELA & Mathematics 11 and Science 10. The Grades 3–8 ELA and mathematics results from December 2020 remain the same but are included in this report so all up-to-date ISASP linking study results are in one location.

Executive Summary

To predict student achievement on the Iowa Statewide Assessment of Student Progress (ISASP) in Grades 3–10 English Language Arts (ELA) and Mathematics, NWEA® conducted a linking study using Spring 2019 data to derive Rasch Unit (RIT) cut scores on the MAP® Growth™ assessments that correspond to the ISASP performance levels. Educators can use this information to identify students at risk of not meeting state proficiency standards early in the year and provide tailored educational interventions.¹ ISASP replaced the Iowa Assessments and was first administered in Spring 2019. The linking study was updated in December 2020 to generate MAP Growth cut scores for the new summative assessments in Grades 3–8 and to provide percentiles corresponding to the new 2020 NWEA MAP Growth norms (Thum & Kuhfeld, 2020). The linking study has been updated again to include the Grades 9–10 cut scores using Spring 2019 data. Results from the December 2020 linking study for Grades 3–8 remain the same but are included in this report so all up-to-date ISASP linking study results are in one location.

Table E.1 presents the ISASP *Proficient* performance level cut scores and the corresponding MAP Growth RIT cut scores that allow teachers to identify students who are on track for proficiency on the state summative test and those who are not. For example, the *Proficient* cut score on the ISASP Grade 3 ELA test is 398. A Grade 3 student with a MAP Growth Reading RIT score of 184 in the fall is likely to meet proficiency on the ISASP ELA test in the spring, whereas a Grade 3 student with a MAP Growth Reading RIT score lower than 184 in the fall is in jeopardy of not meeting proficiency. MAP Growth cut scores for Grade 2 are also provided so educators can track early learners' progress toward proficiency on the ISASP test by Grade 3. These cut scores were derived based on the Grade 3 cuts and the 2020 NWEA growth norms for the adjacent grade (e.g., Grades 2 to 3).

Table E.1. MAP Growth Cut Scores for ISASP Proficiency

Assessment	Proficient Cut Scores								
	2	3	4	5	6	7	8	9	10
ELA/Reading									
ISASP Spring	—	398	414	437	456	475	494	505	530
MAP Growth	Fall	169	184	192	201	205	209	213	213
	Winter	179	192	198	206	209	213	216	215
	Spring	183	195	201	208	211	214	217	218
Mathematics									
ISASP Spring	—	390	409	429	450	469	490	513	537
MAP Growth	Fall	168	182	192	200	208	213	218	222
	Winter	177	190	199	206	213	216	221	225
	Spring	183	195	203	210	216	219	223	229

¹ This study provides MAP Growth cut scores that predict proficiency on the ISASP assessments for Grades 2–10 only. They represent a higher level of achievement than universal screening cut scores designed to identify students with the most severe learning difficulties who may need intensive intervention. MAP Growth universal screening cut scores for Grades K–8 in ELA and mathematics are available in a separate report (He & Meyer, 2021).

Please note that the results in this report may differ from those found in the NWEA reporting system for individual districts. The typical growth scores from fall to spring or winter to spring used in this report are based on the default instructional weeks most encountered for each term (i.e., Weeks 4, 20, and 32 for fall, winter, and spring, respectively). However, instructional weeks often vary by district, so the cut scores in this report may differ slightly from the MAP Growth score reports that reflect the specific instructional weeks set by partners.

E.1. Assessment Overview

The ISASP Grades 3–10 ELA and Mathematics tests are Iowa’s state summative assessments aligned to the Iowa Core Standards. Based on their test scores, students are placed into one of three performance levels: *Not Yet Proficient*, *Proficient*, and *Advanced*. The *Proficient* cut score demarks the minimum level of achievement considered to be proficient. MAP Growth tests are adaptive interim assessments aligned to state-specific content standards and administered in the fall, winter, and spring. Scores are reported on the RIT vertical scale with a range of 100 to 350.

E.2. Linking Methods

The equipercentile linking method was used to identify the spring MAP Growth scores that correspond to the spring ISASP performance level cut scores. MAP Growth fall and winter cut scores that predict proficiency on the spring ISASP test were then projected using the 2020 NWEA growth norms that provide expected score gains across test administrations. The Grade 2 cuts were derived based on the cuts for Grade 3 and the 2020 NWEA growth norms.

E.3. Student Sample

Table E.2 presents the number of Iowa students from nine districts and 50 schools who were included in the linking study sample for Grades 3–8 and from 10 districts and 11 schools who were included for Grades 9–10. Only students who took both the MAP Growth and ISASP assessments in Spring 2019 were included.

Table E.2. Linking Study Sample

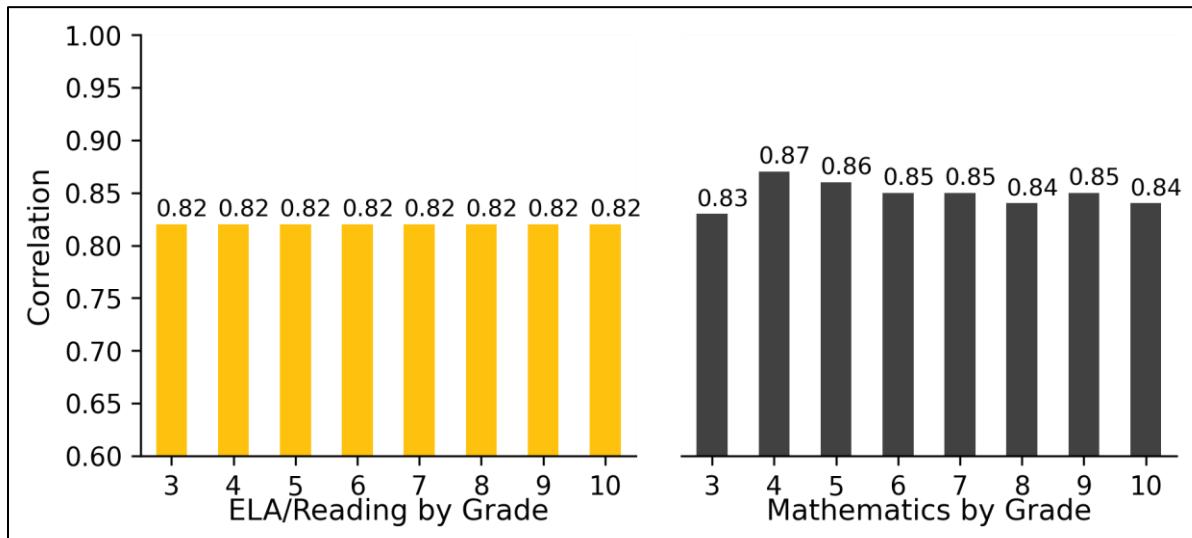

Grade	#Students	
	ELA/Reading	Mathematics
3	1,273	1,270
4	1,449	1,313
5	2,494	2,361
6	2,620	2,606
7	2,698	2,689
8	2,853	2,850
9	1,287	1,269
10	1,185	1,109

The linking study sample is voluntary and can only include student scores from partners who share their data. Also, not all students in a state take MAP Growth. The sample may therefore be different from the general student population in important characteristics. To ensure that the linking study sample represents the state student population in terms of race, sex, and performance level, post-stratification weighting was applied to statistically adjust the sample so it reflects the target population on these variables. As a result, the RIT cuts derived from the study sample can be generalized to any student from the target population. All analyses in this study for Grades 3–10 were conducted based on the weighted sample.

E.4. Test Score Relationships

Correlations between MAP Growth RIT scores and ISASP scores range from 0.82 to 0.87 across content areas, as shown in Figure E.1. These values indicate a strong relationship among the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the ISASP assessments.

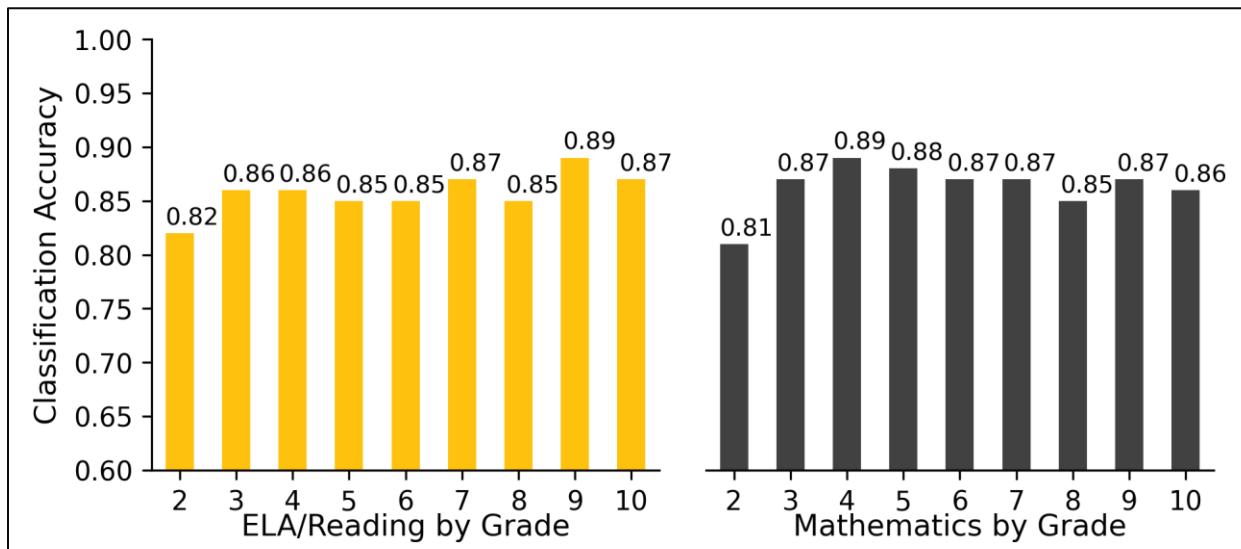

Figure E.1. Correlations between MAP Growth and ISASP Test Scores

E.5. Accuracy of MAP Growth Classifications

Figure E.2 presents the classification accuracy statistics that show the proportion of students correctly classified by their RIT scores as proficient or not proficient on the ISASP tests. For example, the MAP Growth Reading Grade 3 *Proficient* cut score has a 0.86 accuracy rate, meaning it accurately classified student achievement on the state test for 86% of the sample. The results range from 0.81 to 0.89 across both content areas, indicating that RIT scores have a high accuracy rate of identifying student proficiency on the ISASP tests.

Figure E.2. Accuracy of MAP Growth Classifications

1. Introduction

1.1. Purpose of the Study

NWEA® is committed to providing partners with useful tools to help make inferences about student learning from MAP® Growth™ test scores. One important use of MAP Growth results is to predict a student's performance on the state summative assessment at different times throughout the year. This allows educators and parents to determine if a student is on track in their learning to meet state standards by the end of the year or, given a student's learning profile, is on track to obtain rigorous, realistic growth in their content knowledge and skills.

This document presents results from a linking study conducted by NWEA to statistically connect the scores of the Iowa Statewide Assessment of Student Progress (ISASP) Grades 3–10 English Language Arts (ELA) and Mathematics assessments with Rasch Unit (RIT) scores from the MAP Growth assessments taken during the Spring 2019 term. MAP Growth cut scores are also included for Grade 2 so educators can track early learners' progress toward proficiency on the ISASP test by Grade 3. Specifically, this report presents the following results:

1. Student sample demographics
2. Descriptive statistics of test scores
3. MAP Growth cut scores from fall, winter, and spring that correspond to the performance levels for the spring ISASP assessment
4. Classification accuracy statistics to determine the degree to which MAP Growth accurately predicts student proficiency status on the ISASP tests
5. The probability of achieving grade-level proficiency on the ISASP assessment based on MAP Growth RIT scores from fall, winter, and spring

The linking study was updated in December 2020 to generate MAP Growth cut scores for the new Iowa summative assessments in Grades 3–8 and to provide percentiles corresponding to the new 2020 NWEA MAP Growth norms (Thum & Kuhfeld, 2020). The linking study has been updated again to include the Grades 9–10 cut scores using Spring 2019 data.

1.2. Assessment Overview

The ISASP Grades 3–10 ELA and Mathematics summative assessments are aligned to the Iowa Core Standards. Each assessment has two cut scores (i.e., the minimum score a student must get on a test to be placed in a certain performance level) that distinguish between the following performance levels: *Not Yet Proficient*, *Proficient*, and *Advanced*. The *Proficient* cut score marks the minimum level of performance considered to be proficient for accountability purposes.

MAP Growth interim assessments from NWEA are computer adaptive and aligned to state-specific content standards. Scores are reported on the RIT vertical scale with a range of 100 to 350. Each content area has its own scale. To aid the interpretation of scores, NWEA periodically conducts norming studies of student and school performance on MAP Growth. Achievement status norms show how well a student performed on the MAP Growth test compared to students in the norming group. It does this by associating the student's performance on the MAP Growth test, expressed as a RIT score, with a percentile ranking. Growth norms provide expected score gains across test administrations (e.g., the relative evaluation of a student's growth from fall to spring). The most recent norms study was conducted in 2020 (Thum & Kuhfeld, 2020).

2. Methods

2.1. Data Collection

This linking study is based on data from the Spring 2019 administrations of the MAP Growth and ISASP assessments. NWEA recruited Iowa districts to participate in the study by sharing their student and score data for the target term. Districts also gave NWEA permission to use their students' MAP Growth scores from the NWEA in-house database. Once state score information was received by NWEA, each student's state testing record was matched to their MAP Growth score based on the student's first and last names, date of birth, student ID, and other available identifying information. Only students who took both the MAP Growth and ISASP assessments in Spring 2019 were included in the study sample.

2.2. Post-Stratification Weighting

Post-stratification weights were applied to the calculations to ensure that the linking study sample represented the state's test-taking student population in terms of race, sex, and performance level. These variables were selected because they are known to be correlated with students' academic achievement and are often readily available in state summative assessment reports. The weighted sample should match the target population as closely as possible on the key demographics and performance characteristics as defined by the state.

Specifically, a raking procedure was used to calculate the post-stratification weights that either compensate for the underrepresentation of certain groups or attenuate the overrepresentation of certain groups. Raking uses iterative procedures to obtain weights that match sample marginal distributions to known population margins. The following steps were taken during this process:

1. Calculate marginal distributions of race, sex, and performance level for the sample and population.
2. Calculate post-stratification weights with the rake function from the survey package in R (Lumley, 2019).
3. Trim the weights that are outside the range of 0.3 to 3.0.
4. Apply the weights to the sample before conducting the linking study analyses.

2.3. MAP Growth Cut Scores

MAP Growth cut scores that predict student achievement on the ISASP assessment are reported for Grades 3–10, as well as for Grade 2 so educators can track early learners' progress toward proficiency on the ISASP test by Grade 3. Percentile ranks based on the 2020 NWEA norms are also provided. These are useful for understanding how students' scores compare to peers nationwide and the relative rigor of a state's performance level designations for its summative assessment.

The equipercentile linking method (Kolen & Brennan, 2004) was used to identify the spring MAP Growth RIT scores for Grades 3–10 that correspond to the spring ISASP performance level cut scores. The equipercentile linking procedure matches scores on the two scales that have the same percentile rank (i.e., the proportion of tests at or below each score). For example, let x represent a score on Test X (e.g., ISASP). Its equipercentile equivalent score on Test Y (e.g., MAP Growth), $e_y(x)$, can be obtained through a cumulative-distribution-based linking function defined in Equation 1:

$$e_y(x) = G^{-1}[P(x)] \quad (1)$$

where $e_y(x)$ is the equipercentile equivalent of score x on ISASP on the scale of MAP Growth, $P(x)$ is the percentile rank of a given score on ISASP, and G^{-1} is the inverse of the percentile rank function for MAP Growth that indicates the score on MAP Growth corresponding to a given percentile. Polynomial loglinear pre-smoothing was applied to reduce irregularities of the score distributions and equipercentile linking curve.

The MAP Growth conditional growth norms provide students' expected score gains across terms, such as growth from fall to spring within the same grade or from spring of a lower grade to spring of the adjacent higher grade. This information was used to calculate the fall and winter cut scores for Grades 3–10. Equation 2 was used to determine the previous term's or grade's MAP Growth score needed to reach the spring cut score, considering the expected growth associated with the previous RIT score:

$$RIT_{PredSpring} = RIT_{previous} + g \quad (2)$$

where:

- $RIT_{PredSpring}$ is the predicted MAP Growth spring score.
- $RIT_{previous}$ is the previous term's or grade's RIT score.
- g is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT.

The MAP Growth conditional growth norms were also used to calculate the fall, winter, and spring cuts for Grade 2. To derive the spring cut scores for Grade 2, the growth score from spring of one year to the next was used (i.e., the growth score from spring Grade 2 to spring Grade 3). The calculation of fall and winter cuts for Grade 2 followed the same process as the other grades. For example, the growth score from fall to spring in Grade 2 was used to calculate the fall cuts for Grade 2.

2.4. Classification Accuracy

The degree to which MAP Growth predicts student proficiency status on the ISASP tests can be described using classification accuracy statistics based on the MAP Growth spring RIT cut scores. The results show the proportion of students who are correctly classified by their RIT scores as proficient or not proficient on the ISASP test. Table 2.1 describes the classification accuracy statistics provided in this report (Pommerich et al., 2004).

Iowa students do not begin taking the ISASP assessment until Grade 3. Thus, cut scores for Grade 2 were interpolated by obtaining longitudinal data for the Grade 3 cohort. For each Grade 3 student in the study sample, their MAP Growth data from the prior year when they were in Grade 2 during 2017–2018 were obtained. In this way, the data came from the same cohort of students beginning when they were in Grade 2 and continuing through Grade 3. A summary of how well the interpolated Grade 2 cuts predict Grade 3 proficiency status is reported in the classification accuracy statistics.

Table 2.1. Description of Classification Accuracy Summary Statistics

Statistic	Description*	Interpretation
Overall Classification Accuracy Rate	$(TP + TN) / (\text{total sample size})$	Proportion of the study sample whose proficiency classification on the state test was correctly predicted by MAP Growth cut scores
False Negative (FN) Rate	$FN / (FN + TP)$	Proportion of not-proficient students identified by MAP Growth in those observed as proficient on the state test
False Positive (FP) Rate	$FP / (FP + TN)$	Proportion of proficient students identified by MAP Growth in those observed as not proficient on the state test
Sensitivity	$TP / (TP + FN)$	Proportion of proficient students identified by MAP Growth in those observed as such on the state test
Specificity	$TN / (TN + FP)$	Proportion of not-proficient students identified by MAP Growth in those observed as such on the state test
Precision	$TP / (TP + FP)$	Proportion of observed proficient students on the state test in those identified as such by the MAP Growth test
Area Under the Curve (AUC)	Area under the receiver operating characteristics (ROC) curve	How well MAP Growth cut scores separate the study sample into proficiency categories that match those from the state test cut scores. An AUC at or above 0.80 is considered “good” accuracy.

*FP = false positives. FN = false negatives. TP = true positives. TN = true negatives.

2.5. Proficiency Projection

In addition to calculating the MAP Growth fall and winter cut scores (and the Grade 2 cut scores), the MAP Growth conditional growth norms data were also used to calculate the probability of reaching proficiency on the ISASP test based on a student’s RIT scores from fall, winter, and spring. Equation 3 was used to calculate the probability of a student achieving *Proficient* on the ISASP test based on their fall or winter RIT score:

$$Pr(\text{Achieving Proficient in spring} | \text{starting RIT}) = \Phi\left(\frac{RIT_{previous} + g - RIT_{SpringCut}}{SD}\right) \quad (3)$$

where:

- Φ is a standardized normal cumulative distribution.
- $RIT_{previous}$ is the student’s RIT score in fall or winter (or in spring of Grade 2).
- g is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT.
- $RIT_{SpringCut}$ is the MAP Growth *Proficient* cut score for spring. For Grade 2, this is the Grade 3 cut score for spring.
- SD is the conditional standard deviation of the expected growth, g .

Equation 4 was used to estimate the probability of a student achieving *Proficient* on the ISASP test based on their spring RIT score (RIT_{Spring}):

$$Pr(\text{Achieving Proficient in spring} | \text{spring RIT}) = \Phi\left(\frac{RIT_{Spring} - RIT_{SpringCut}}{SE}\right) \quad (4)$$

where SE is the standard error of measurement for MAP Growth.

3. Results

3.1. Study Sample

Only students who took both the MAP Growth and ISASP assessments in Spring 2019 were included in the study sample. Data used in this study were collected from nine districts and 50 schools in Iowa for Grades 3–8 and from 10 districts and 11 schools for Grades 9–10. As mentioned in Section 2.2, the demographic categories as defined by the state’s assessment report for each grade level were used in the post-stratification weighting calculations. Some race categories were collapsed to avoid having null (e.g., missing) cells that prevent the post-stratification weighting from being performed. In the Grades 3–8 sample, the smaller American Indian/Alaska Native (AI/AN), Native Hawaiian/Pacific Islander (NH/PI), and Not Specified groups were combined into Other to preserve these observations. In the Grades 9–10 sample, NH/PI was combined with Asian to preserve the small counts of the NH/PI observations. The demographic distributions are therefore presented separately for the Grades 3–8 and 9–10 samples.

The first three tables present the sample data for Grades 3–8. Table 3.1 presents the demographic distributions of race, sex, and performance level in the original unweighted study sample. Table 3.2 presents the distributions of the target population of students who took the Spring 2019 ISASP tests. Table 3.3 presents the demographic and performance distributions of the sample after weighting, which are almost identical to the ISASP student population distributions. Table 3.4 presents study sample information for Grades 9–10. The analyses in this study were conducted using the weighted sample.

3.2. Descriptive Statistics

Table 3.5 presents descriptive statistics of the MAP Growth and ISASP test scores from Spring 2019, including the correlation coefficient (r) between them. The correlation coefficient between the scores is 0.82 for all grades in ELA/reading and ranges from 0.83 to 0.87 for mathematics. These values indicate a strong relationship among the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the ISASP assessments.

Table 3.5. Descriptive Statistics of Test Scores

Grade	N	r	ISASP *				MAP Growth*			
			Mean	SD	Min.	Max.	Mean	SD	Min.	Max.

*SD = standard deviation. Min. = minimum. Max. = maximum.

3.3. MAP Growth Cut Scores

Table 3.6 and Table 3.7 present the ISASP scale score ranges and the corresponding MAP Growth RIT cut scores and percentile ranges by content area and grade. These tables can be used to predict a student's likely performance level on the ISASP spring assessment when MAP Growth is taken in the fall, winter, or spring. For example, a Grade 3 student who obtained a MAP Growth Reading RIT score of 184 in the fall is likely to reach *Proficient* on the ISASP ELA test. A Grade 3 student who obtained a MAP Growth Reading RIT score of 195 in the spring is also likely to reach *Proficient* on the ISASP assessment. The spring cut score is higher than the fall cut score because growth is expected between fall and spring as students receive more instruction during the school year.

Within this report, the cut scores for fall and winter are derived from the spring cuts and the typical growth scores from fall-to-spring or winter-to-spring. The typical growth scores are based on the default instructional weeks most encountered for each term (Weeks 4, 20, and 32 for fall, winter, and spring, respectively). Since instructional weeks often vary by district, the cut scores in this report may differ slightly from the MAP Growth score reports that reflect instructional weeks set by partners. If the actual instructional weeks deviate substantially from the default ones, a student's expected performance level could be different from the projections presented in this document. Partners are therefore encouraged to use the projected performance level in students' profile, classroom, and grade reports in the NWEA reporting system since they reflect the specific instructional weeks set by partners.

Table 3.6. MAP Growth Cut Scores—ELA/Reading

10	100–228	1–43	229 –262	44–91	263–350

*Cut scores for fall and winter are derived from the spring cuts and growth norms based on the typical instructional weeks. Spring cut scores for Grade 2 were derived from the Grade 3 cuts using the growth norms. Bolded numbers indicate the cut scores considered to be at least proficient for accountability purposes.

3.4. Classification Accuracy

Table 3.8 presents the classification accuracy summary statistics, including the overall classification accuracy rate. These results indicate how well MAP Growth spring RIT scores predict proficiency on the ISASP tests, providing insight into the predictive validity of MAP Growth. The overall classification accuracy rate ranges from 0.82 to 0.89 for ELA/reading and 0.81 to 0.89 for mathematics. These values suggest that the RIT cut scores are good at classifying students as proficient or not proficient on the ISASP assessment. For Grade 2, the classification accuracy rate refers to how well the MAP Growth cuts can predict students' proficiency status on ISASP in Grade 3.

Although the results show that MAP Growth scores can be used to accurately classify students as likely to be proficient on the ISASP tests, there is a notable limitation to how these results should be used and interpreted. ISASP and MAP Growth assessments are designed for different purposes and measure slightly different constructs even within the same content area. Therefore, scores on the two tests cannot be assumed to be interchangeable. MAP Growth may not be used as a substitute for the state tests and vice versa.

Table 3.8. Classification Accuracy Results

Grade	N	Cut Score		Class. Accuracy*	Rate*		Sensitivity	Specificity	Precision	AUC*
		MAP Growth	ISASP		FP	FN

10	1,109	229	537	0.86	0.23	0.10	0.90	0.77	0.89	0.92

*Class. Accuracy = overall classification accuracy rate. FP = false positives. FN = false negatives. AUC = area under the ROC curve.

3.5. Proficiency Projection

Table 3.9 and Table 3.10 present the estimated probability of achieving *Proficient* performance on the ISASP test based on RIT scores from fall, winter, or spring. “Prob.” indicates the probability of obtaining proficient status on the ISASP test in the spring. For example, a Grade 3 student who obtained a MAP Growth Reading score of 198 in the fall has a 95% chance of reaching *Proficient* or higher on the ISASP test in the spring.
