

Predicting Proficiency on the Ohio's State Tests (OST) in Grades 3–8 based on NWEA MAP Growth Scores

July 2023

NWEA Psychometric Solutions

Linking Study Updates

Date	Description
2013-01	Initial study conducted for Ohio in ELA and mathematics in Grades 3–8 using Spring 2012 data.
2016-08	Incorporated the 2015 MAP Growth norms using Spring 2016 data.
2018-03	Updated the report for ELA, mathematics, and science using Spring 2017 data.
2020-07-23	Incorporated the 2020 MAP Growth norms using Spring 2017 data for ELA, mathematics, and science in Grades 3–8. A linking study for the OST End-of-Course (EOC) assessments in ELA and mathematics was also conducted. Results are provided in a separate report (NWEA, 2020).
2021-12-17	Updated the results for the OST Science assessment using Spring 2021 data. The ELA and mathematics results from July 2020 remain the same but are included in this report so all up-to-date OST 3–8 linking study results are in one place.
2023-01-06	Updated results for the OST ELA & Math assessments using Spring 2022 data. Science results from December 2021 remain the same. All up to date 3–8 linking study results are in this one report.
2023-03-24	Updated charts to gray scale and made minor modifications to some language within the report.
2023-07-05	Reviewed and updated the report <i>Section 3.4 Reading Grade 3 Cut Scores for Ohio's TGRG Program</i> .

Acknowledgements: This report benefited from the project management and editorial assistance of Debbie Bauman, the data analysis of Sarah-Truclinh Tran, psychometric analysis of Yuhong Ji, and the psychometric leadership of Ann Hu. We appreciate our colleagues at NWEA who assisted in partner recruitment and are grateful to all our partners who provided data for the study.

Executive Summary

Linking studies allow partners to use MAP® Growth™ Rasch Unit (RIT) scores throughout the year to predict their students' likely performance levels on the state summative assessment. This is accomplished through statistical analyses that produce RIT cut scores corresponding to the state summative performance levels. A *cut score* is the minimum score a student must get on a test to be placed at a certain performance level. The linking study for the Ohio's State Tests (OST) described in this report provides RIT cut scores for the fall, winter, and spring MAP Growth administrations that correspond to the OST performance levels for Mathematics and English Language Arts (ELA)/Reading in Grades 3–8 and for Science in Grades 5 and 8.

The linking study is based on test scores from students who took both the MAP Growth and OST assessments using Spring 2022 data for the targeted grades. The linking study sample included 71,975 students across 48 districts and 232 schools in Ohio. Scores from both tests were used as the basis for linking the two assessments.

Before the linking analyses began, NWEA confirmed that the MAP Growth and OST assessments are aligned based on the same or similar set of content standards to warrant a connection. The test links were further investigated by calculating the Pearson correlation coefficients that relate the relationship between the specific MAP Growth and OST test scores. At NWEA, a correlation of $r \geq 0.70$ is considered a "high" correlation and acceptable for publishing. This indicates that students who perform well on one assessment also tend to perform well on the other, and vice versa. A perfect positive correlation is 1.00. The correlations between the MAP Growth and OST test scores from Spring 2022, shown below, are consistent with our expectations that MAP Growth is a good assessment for predicting performance on the OST.

Figure E.1. Correlations between MAP Growth and OST Scores

The equipercentile linking method (Kolen & Brennan, 2004) and the 2020 MAP Growth norms (Thum & Kuhfeld, 2020) were then used to produce the RIT cut scores that correspond to performance on the OST assessment for every subject and grade. While RIT cut scores were generated for every performance level on the OST assessment, Table E.1 presents the *Proficient* cut scores that indicate the minimum score a student must get to be considered proficient (reaching *Proficient* or higher).

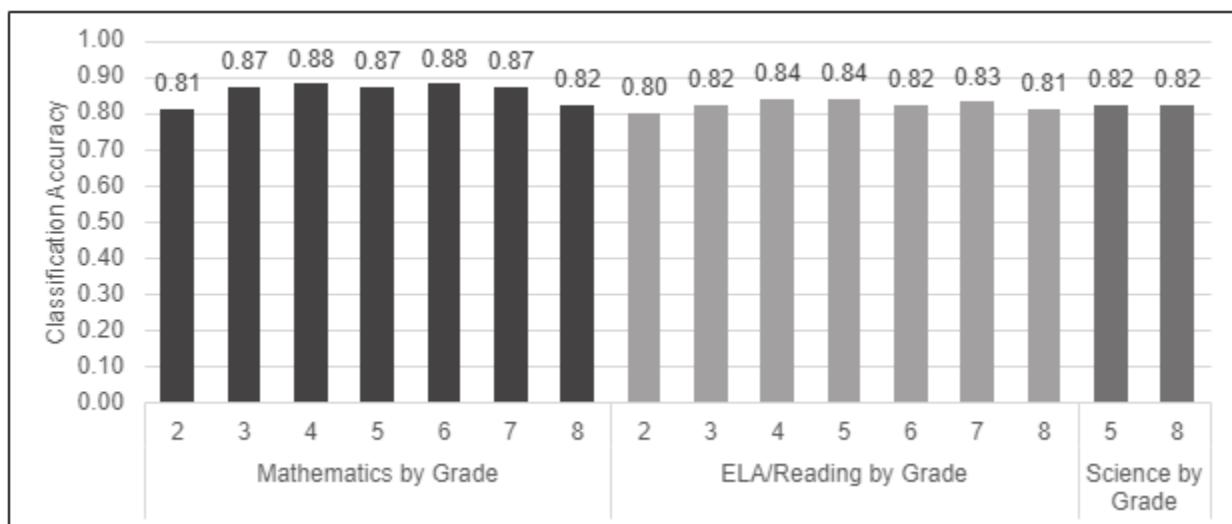

Table E.1. MAP Growth RIT Cut Scores for OST Proficiency

Assessment		Proficient Cut Scores by Grade						
		2	3	4	5	6	7	8
Mathematics								
OST Spring		–	700	700	700	700	700	700
MAP Growth	Fall	172	186	194	206	214	220	223
	Winter	182	194	201	212	219	224	226
	Spring	187	199	205	216	222	227	228
ELA/Reading								
OST Spring		–	700	700	700	700	700	700
MAP Growth	Fall	171	185	195	199	209	210	217
	Winter	180	193	201	204	212	214	220
	Spring	184	196	203	206	214	215	221
Science								
OST Spring		–	–	–	700	–	–	700
MAP Growth	Fall	–	–	–	199	–	–	207
	Winter	–	–	–	203	–	–	210
	Spring	–	–	–	205	–	–	211

Educators can use these cut scores to determine whether students are on track for proficiency on the state assessment. For example, the *Proficient* cut score on the Grade 3 OST Mathematics test is 700. A Grade 3 student with a MAP Growth Mathematics RIT score of 186 in the fall is likely to meet expectations on the OST Mathematics test in the spring, whereas a Grade 3 student with a RIT score lower than 186 in the fall is in jeopardy of not meeting proficiency. MAP Growth cut scores for Grade 2 are also provided so educators can track early learners' progress toward expectations on the OST assessment by Grade 3.

As further evidence that MAP Growth scores can be used to predict students' proficiency on the state test, NWEA calculated classification accuracy statistics that show how well the RIT scores can correctly classify, or predict, students as proficient on the state tests. For example, the Grade 3 MAP Growth Mathematics cut score correctly classified students' proficiency (*Proficient* or higher) on the OST Mathematics test 87% of the time. A high statistic indicates high accuracy. Overall, MAP Growth scores have a high accuracy rate of identifying student proficiency on the OST tests, as illustrated below.

Figure E.2. Accuracy of MAP Growth Classifications

Please note that the purpose of this report is to explain NWEA's linking study methodology. It is not meant as the main reference for determining a student's likely performance on the state summative assessment. The cut scores in this report are based on the default instructional weeks most encountered for each term (i.e., Weeks 4, 20, and 32 for fall, winter, and spring), whereas instructional weeks often vary by district. The cut scores in this report may therefore differ from the results in the NWEA reporting system that reflect the specific instructional weeks set by partners. Partners should therefore reference their MAP Growth score reports instead.

1. Introduction

1.1. Purpose of the Study

NWEA® is committed to providing partners with useful tools to help make inferences about student learning from MAP® Growth™ test scores. One important use of MAP Growth results is to predict a student's performance on the state summative assessment at different times throughout the year. This allows educators and parents to determine if a student is on track in their learning to meet state standards by the end of the year or, given a student's learning profile, is on track to obtain rigorous, realistic growth in their content knowledge and skills.

This document presents results from a linking study conducted by NWEA to statistically connect Rasch Unit (RIT) scores from the MAP Growth assessments with scores from the Ohio's State Tests (OST) Mathematics and English Language Arts (ELA)/Reading in Grades 3–8 and Science in Grades 5 and 8 taken during the Spring 2022 term.¹ MAP Growth cut scores are also included for Grade 2 so educators can track early learners' progress toward proficiency on the OST test by Grade 3. Specifically, this report presents the following results:

1. Student sample demographics
2. Descriptive statistics of test scores
3. MAP Growth cut scores from fall, winter, and spring that correspond to the performance levels on the spring OST assessment
4. Classification accuracy statistics to determine the degree to which MAP Growth accurately predicts student proficiency status on the OST tests
5. The probability of achieving grade-level proficiency on the OST assessment based on MAP Growth RIT scores from fall, winter, and spring

The linking study has been updated since the previous version published in December 2021.

1.2. Assessment Overview

The OST Grades 3–8 Mathematics and ELA, and Grades 5 and 8 Science tests are Ohio's state summative assessments aligned to the Ohio's Learning Standards. Based on their test scores, students are placed into one of five performance levels: *Limited*, *Basic*, *Proficient*, *Accomplished*, and *Advanced*. The *Proficient* cut score demarks the minimum level of achievement considered to be proficient for accountability purposes.

MAP Growth tests are adaptive interim assessments aligned to state-specific content standards and administered in the fall, winter, and spring. Scores are reported on the RIT vertical scale with a range of 100 to 350. NWEA conducts norming studies of student and school performance on MAP Growth assessments to aid the interpretation of scores. Growth norms provide expected score gains for a test from term to term, such as from fall to spring terms. The most recent norms study was conducted in 2020.

¹ This study provides MAP Growth cut scores that predict proficiency on the OST for Grades 2–8 only. They represent a higher level of achievement than universal screening cut scores designed to identify students with the most severe learning difficulties who may need intensive intervention. MAP Growth universal screening cut scores for Grades K–8 in reading and mathematics are available in a separate report (He & Meyer, 2021).

2. Methods

2.1. Data Collection

This linking study is based on data from the Spring 2022 administrations of the MAP Growth and OST assessments. NWEA recruited Ohio districts to participate in the study by sharing their student and score data for the target term. Districts also gave NWEA permission to use their students' MAP Growth scores from the NWEA in-house database. Once state score information was received by NWEA, each student's state testing record was matched to their MAP Growth score based on the student's first and last names, date of birth, student ID, and other available identifying information. Only students who took both the MAP Growth and OST assessments were included in the study sample.

2.2. Post-Stratification Weighting

Post-stratification weights were applied to the calculations to ensure that the linking study sample represented the state's test-taking student population in terms of race, sex, and performance level. These variables were selected because they are known to be correlated with students' academic achievement and are often available in state summative assessment reports. The weighted sample will match the target population as closely as possible on the key demographics and performance characteristics as defined by the state.

A raking procedure was used to calculate the post-stratification weights that either compensate for the underrepresentation of certain groups or attenuate the overrepresentation of certain groups. Raking uses iterative procedures to obtain weights that match sample marginal distributions to known population margins. The following steps were taken during this process:

1. Calculate marginal distributions of race, sex, and performance level for the sample and population.
2. Calculate post-stratification weights with the rake function from the survey package in R (Lumley, 2019).
3. Trim the weights that are outside the range of 0.3 to 3.0.
4. Apply the weights to the sample before conducting the linking study analyses.

2.3. Descriptive Statistics

Descriptive statistics are provided to summarize the test scores for both the MAP Growth and OST assessments, including the test score mean, standard deviation (SD), minimum, and maximum. The mean presents the average test scores across all students in the study sample, and the SD indicates the variability of test scores, revealing how students' scores are distributed around the average score, or mean. Correlation coefficients between the MAP Growth RIT scores and OST scores are also provided to answer the question, "How well do the test scores from MAP Growth that reference the RIT scale correlate to the scores obtained from the OST test that references some other scale in the same subject?" The correlations were calculated as follows:

$$r = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum (x_i - \bar{x})^2 \sum (y_i - \bar{y})^2}} \quad (1)$$

where r is the correlation coefficient, x_i and y_i are the values of the x- and y-variables in a sample, and \bar{x} and \bar{y} are the mean of the values of the x- and y-variables.

2.4. MAP Growth Cut Scores

MAP Growth cut scores that predict student achievement on the OST assessments are reported for Grades 3–8, as well as for Grade 2 so educators can track early learners' progress toward proficiency on the OST test by Grade 3. Percentile ranks based on the 2020 NWEA norms are also provided. These are useful for understanding how students' scores compare to peers nationwide and the relative rigor of a state's performance level designations for its summative assessment.

The equipercentile linking method was used to identify the spring MAP Growth RIT scores for Grades 3–8 that correspond to the spring OST performance level cut scores. The equipercentile linking procedure matches scores on the two scales that have the same percentile rank (i.e., the proportion of tests at or below each score). For example, let x represent a score on Test X (e.g., OST). Its equipercentile equivalent score on Test Y (e.g., MAP Growth), $e_y(x)$, can be obtained through a cumulative-distribution-based linking function defined in Equation 2:

$$e_y(x) = G^{-1}[P(x)] \quad (2)$$

where $e_y(x)$ is the equipercentile equivalent of score x on OST on the scale of MAP Growth, $P(x)$ is the percentile rank of a given score on OST and G^{-1} is the inverse of the percentile rank function for MAP Growth that indicates the score on MAP Growth corresponding to a given percentile. Polynomial loglinear pre-smoothing was applied to reduce irregularities of the score distributions and equipercentile linking curve.

The MAP Growth conditional growth norms provide students' expected score gains across terms, such as growth from fall to spring within the same grade or from spring of a lower grade to spring of the adjacent higher grade. This information was used to calculate the fall and winter cut scores for Grades 3–8. Equation 3 was used to determine the previous terms MAP Growth score needed to reach the spring cut score, considering the expected growth associated with the previous RIT score:

$$RIT_{predSpring} = RIT_{previous} + g \quad (3)$$

where:

- $RIT_{predSpring}$ is the predicted MAP Growth spring score.
- $RIT_{previous}$ is the previous terms RIT score.
- g is the expected growth from the previous fall or winter RIT to the spring RIT score.

Students do not take the OST assessment in Grade 2. Therefore, the MAP Growth conditional growth norms were also used to estimate the fall, winter, and spring cuts in Grade 2 that are needed to meet OST proficiency in Grade 3. To derive the Grade 2 spring cut scores, the growth score from spring of one year to the next was used (i.e., the growth score from spring of Grade 2 to spring of Grade 3). The estimations of fall and winter cuts followed the same process as above for Grades 3–8. For example, the projected growth from fall to spring in Grade 2 was used to calculate the fall cuts for Grade 2.

2.5. Classification Accuracy

The degree to which MAP Growth predicts student proficiency status on the OST tests can be described using classification accuracy statistics based on the MAP Growth spring RIT cut scores. The results show the proportion of students correctly classified by their RIT scores as proficient or not proficient on the OST test. The classification accuracy statistics for Grade 2 were calculated by obtaining current Grade 3 students' MAP Growth scores from the previous year. Thus, the classification accuracy statistics for Grade 2 represent how well these estimated RIT cuts predict proficiency in the OST assessments in Grades 3, respectively, in our study sample. Table 2.1 describes the classification accuracy statistics in this report (Pommerich et al., 2004).

Table 2.1. Description of Classification Accuracy Summary Statistics

Statistic	Description*	Interpretation
Overall Classification Accuracy Rate	$(TP + TN) / (\text{total sample size})$	Proportion of the study sample whose proficiency classification on the state test was correctly predicted by MAP Growth cut scores
False Negative (FN) Rate	$FN / (FN + TP)$	Proportion of not-proficient students identified by MAP Growth in those observed as proficient on the state test
False Positive (FP) Rate	$FP / (FP + TN)$	Proportion of proficient students identified by MAP Growth in those observed as not proficient on the state test
Sensitivity	$TP / (TP + FN)$	Proportion of proficient students identified by MAP Growth in those observed as such on the state test
Specificity	$TN / (TN + FP)$	Proportion of not-proficient students identified by MAP Growth in those observed as such on the state test
Precision	$TP / (TP + FP)$	Proportion of observed proficient students on the state test in those identified as such by the MAP Growth test
Area Under the Curve (AUC)	Area under the receiver operating characteristics (ROC) curve	How well MAP Growth cut scores separate the study sample into proficiency categories that match those from the state test cut scores. An AUC at or above 0.80 is considered "good" accuracy.

*FP = false positives. FN = false negatives. TP = true positives. TN = true negatives.

2.6. Proficiency Projections

Given that all test scores contain measurement errors, reaching the *Proficient* RIT cut does not guarantee that the student is proficient at the state test. Instead, we can claim that a student with the RIT cut score has a 50% chance of reaching proficiency on the state test, with their chances increasing the greater their score is from the cut. The proficiency projections indicate these probabilities for various RIT scores throughout the year.

In addition to calculating the MAP Growth fall and winter cut scores (and the projected Grade 2 cut scores), the MAP Growth conditional growth norms data were also used to calculate the probability of reaching proficiency on the OST test in the spring based on a student's RIT scores from fall and winter (see Equation 4).

$$Pr(\text{Achieving Proficient in spring} | \text{starting RIT}) = \Phi\left(\frac{RIT_{previous} + g - RIT_{SpringCut}}{SD}\right) \quad (4)$$

where:

- Φ is the standard normal cumulative distribution function.
- $RIT_{previous}$ is the student's RIT score in fall or winter (or in spring of Grade 2).
- g is the expected growth from the previous fall or winter RIT to the spring RIT.
- $RIT_{SpringCut}$ is the MAP Growth cut score associated with state proficiency in spring. For Grade 2, this is the Grade 3 cut score for spring.
- SD is the conditional standard deviation of the expected growth, g .

Equation 5 was used to estimate the probability of a student achieving *Proficient* performance on the OST test based on their spring RIT score (RIT_{Spring}):

$$Pr(Achieving \text{ Proficient} \text{ in } \text{spring} \mid \text{spring RIT}) = \Phi\left(\frac{RIT_{Spring} - RIT_{SpringCut}}{SE}\right) \quad (5)$$

where SE is the standard error of measurement for MAP Growth.

3. Results

3.1. Study Sample

Only students who took both the MAP Growth and OST assessments in Spring 2022 for the target subjects were included in the sample. Data were collected from 48 districts and 232 schools in Ohio. Table 3.1 presents the distributions of student race, sex, and performance level in the original unweighted study sample. Table 3.2 presents the distributions of the target population of students who took the OST tests. Since the original study sample is different from the target OST population, post-stratification weights were applied. Table 3.3 presents the demographic distributions of the sample after weighting, which are almost identical to the OST student population distributions.

*NHPI = Native Hawaiian or Pacific Islander. Other racial categories include Multi-race and Not Specified.

3.2. Descriptive Statistics

Table 3.4 presents descriptive statistics of the MAP Growth and OST test scores from Spring 2022, including the correlation coefficient (r) between them. The correlations between the scores are 0.77 to 0.86 for Mathematics, 0.77 to 0.81 for ELA/Reading, and 0.71 or 0.73 for Science. These values indicate a high positive correlation among the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the OST assessments.

Table 3.4. Descriptive Statistics of Test Scores

*SD = standard deviation. Min. = minimum. Max. = maximum.

3.3. MAP Growth Cut Scores

Table 3.5, Table 3.6, and Table 3.7 present the OST scale score ranges and the corresponding MAP Growth RIT cut scores and percentile ranges by content area and grade. Bolded numbers highlight the cut scores considered to be proficient for accountability purposes. These tables can be used to gauge a student's likely performance level on the OST spring assessment when MAP Growth is taken in the fall, winter, or spring. For example, a Grade 3 student who obtained a MAP Growth Mathematics RIT score of 186 in the fall is likely to achieve *Proficient* performance on the OST Mathematics test. The same is true for a Grade 3 student who obtained a MAP Growth Mathematics RIT score of 199 in the spring. The spring cut score is higher than the fall cut score because of expected growth during the school year as students receive more instruction.

Within this report, the cut scores for fall and winter are derived from the spring cuts and the typical growth scores from fall-to-spring or winter-to-spring. The typical growth scores are based on the default instructional weeks most encountered for each term (Weeks 4, 20, and 32 for fall, winter, and spring, respectively). Since instructional weeks often vary by district, the cut scores in this report may differ slightly from the MAP Growth score reports that reflect instructional weeks set by partners. If the actual instructional weeks deviate substantially from the default ones, a student's expected performance level could be different from the projections presented in this report. Partners are therefore encouraged to use the projected performance level in students' score reports since they reflect the specific instructional weeks set by partners.

3.4. Third Grade Reading Guarantee

The purpose of Ohio’s Third Grade Reading Guarantee (TGRG) program is to identify K–3 students who are behind in reading, allowing schools to provide additional support to help students achieve reading success by the end of Grade 3. In June 2023, the Ohio State Board of Education decided that students who score 690 and higher on the OST ELA test or 48 and higher on the reading subscore will be eligible for TGRG promotion at the end of the year.²

Table 3.8 presents the MAP Growth Reading RIT cut scores corresponding to the TGRG promotion cuts, including the MAP Growth classification accuracy results based on a sample of 8,179 students for whom we have both MAP Growth Reading RIT and OST Reading subscore information from Spring 2022.

Table 3.8. MAP Growth Reading Grade 3 Cut Scores for Ohio’s TGRG Program

Grade	OST Cut Score	MAP Growth Cut		Class. Accuracy
		RIT	Percentile	
OST ELA				
3	690	192	38	0.84
OST Reading				
3	48	192	38	0.86

Given the promotion cuts may change in a given year, Table 3.9 and Table 3.10 provide additional RIT scores corresponding to the OST ELA and Reading scores below and above the current promotion cuts to extend the range of cut scores to cover all possible future OST promotion cuts.

3.5. Classification Accuracy

Table 3.11 presents the classification accuracy summary statistics, including the overall classification accuracy rate. These results indicate how well MAP Growth spring RIT scores predict proficiency on the OST tests, providing insight into the predictive validity of MAP Growth. The overall classification accuracy rate ranges from 0.81 to 0.88 for Mathematics, 0.80 to 0.84 for ELA/Reading, and 0.82 for Science. These values suggest that the RIT cut scores are effective at classifying students as proficient or not proficient on the OST assessment. For Grade 2, the classification accuracy rate refers to how well the MAP Growth cuts can predict students’ proficiency status on OST in Grade 3.

Although the results show that MAP Growth scores can be used to predict student proficiency with relatively high accuracy on the OST tests, there is a notable limitation to how these results should be used and interpreted. The OST and MAP Growth assessments are designed for different purposes and measure slightly different constructs even within the same content area. Therefore, scores on the two tests cannot be assumed to be interchangeable. MAP Growth may not be used as a substitute for the state tests and vice versa.

Table 3.11. Classification Accuracy Results

Grade	N	Cut Score		Class. Accuracy*	Rate*		Sensitivity	Specificity	Precision	AUC*
		MAP Growth	OST		FP	FN				
ELA/Reading										
2	9,178	184	700	0.80	0.24	0.18	0.82	0.76	0.85	0.86

*Class. Accuracy = overall classification accuracy rate. FP = false positives. FN = false negatives. AUC = area under the ROC curve.

3.6. Proficiency Projections

Table 3.12, Table 3.13, and Table 3.14 present the estimated probability of achieving *Proficient* performance on the OST test based on RIT scores from fall, winter, or spring. Due to measurement error in all test scores, the *Proficient* MAP Growth cuts do not guarantee that a student will reach proficiency on the OST. They instead indicate a 50% chance that a student will reach a particular performance level. Therefore, these projections further elucidate the *Proficient* cut scores by providing the likelihood of reaching proficiency on the OST in the spring at a given percentile throughout the year.

For example, the spring Grade 3 *Proficient* RIT cut score for Mathematics is 199, which indicates a 50% chance of achieving proficiency in the spring, as shown in Table 3.12. An educator can also use the table to estimate that a Grade 3 student who obtained a MAP Growth Mathematics score of 187 in the fall has a 56% probability of reaching *Proficient* or higher on the OST test in the spring.
